

**WM8740**

## 24-bit, High Performance 192kHz Stereo DAC

Advanced Information, July 2000, Rev 1.7

### DESCRIPTION

The WM8740 is a very high performance stereo DAC designed for audio applications such as CD, DVD, home theatre systems, set top boxes and digital TV. The WM8740 supports data input word lengths from 16 to 24-bits and sampling rates up to 192kHz. The WM8740 consists of a serial interface port, digital interpolation filter, multi-bit sigma delta modulator and stereo DAC in a small 28-pin SSOP package. The WM8740 also includes a digitally controllable mute and attenuator function on each channel.

The internal digital filter has two selectable roll-off characteristics. A sharp or slow roll-off can be selected dependent on application requirements. Additionally, the internal digital filter can be by-passed and the WM8740 used with an external digital filter.

The WM8740 supports two connection schemes for audio DAC control. The SPI-compatible serial control port provides access to a wide range of features including on-chip mute, attenuation and phase reversal. A hardware controllable interface is also available.

### FEATURES

- 120dB SNR ('A' weighted mono @48kHz), THD+N: -104dB @ FS
- 117dB SNR ('A' weighted stereo @48kHz), THD+N: -104dB @ FS
- Sampling frequency: 8kHz to 192kHz
- Selectable digital filter roll-off
- Optional interface to industry standard external filters
- Differential mono mode needing no glue logic
- Input data word: 16 to 24-bit
- Hardware or SPI compatible serial port control modes:
  - Hardware mode: mute, de-emphasis, audio format control
  - Serial mode: mute, de-emphasis, attenuation (256 steps), phase reversal
- Fully differential voltage outputs

### APPLICATIONS

- CD, DVD audio
- Home theatre systems
- Professional audio systems

## PIN CONFIGURATION

## ORDERING INFORMATION

| DEVICE     | TEMP. RANGE   | PACKAGE     |
|------------|---------------|-------------|
| XWM8740EDS | -25° to +85°C | 28-pin SSOP |

## PIN DESCRIPTION

| PIN | NAME   | TYPE            | DESCRIPTION  |
|-----|--------|-----------------|--|
| 1   | LRCIN  | Digital input   | Sample rate clock input.   |
| 2   | DIN    | Digital input   | Audio data serial input (except in 8XMODE when it is DINL).                      |
| 3   | BCKIN  | Digital input   | Audio data bit clock input .   |
| 4   | MODE8X | Digital input   | Internal pull-down, active high, 8 x fs mode.                                    |
| 5   | SCLK   | Digital input   | System clock input.  |
| 6   | DIFFHW | Digital input   | Internal pull-down, active high, differential mono mode.                         |
| 7   | DGND   | Supply          | Digital ground supply.   |
| 8   | DVDD   | Supply          | Digital positive supply.   |
| 9   | AVDDR  | Supply          | Analogue positive supply.  |
| 10  | AGNDR  | Supply          | Analogue ground supply.  |
| 11  | VMIDR  | Analogue output | Mid rail right channel.  |
| 12  | VOUTRP | Analogue output | Right channel DAC output positive.   |
| 13  | VOUTRN | Analogue output | Right channel DAC output negative.   |
| 14  | AGND   | Supply          | Analogue ground supply.  |
| 15  | AVDD   | Supply          | Analogue positive supply.  |
| 16  | VOUTLN | Analogue output | Left channel DAC output negative.  |
| 17  | VOUTLP | Analogue output | Left channel DAC output positive.  |
| 18  | VMIDL  | Analogue output | Mid rail left channel.   |
| 19  | AGNDL  | Supply          | Analogue ground supply.  |
| 20  | AVDDL  | Supply          | Analogue positive supply.  |
| 21  | ZERO   | Digital output  | Infinite zero detect – active low. Open drain type output with active pull-down. |
| 22  | RSTb   | Digital input   | Reset input – active low. Internal pull-up.                                      |

| PIN | NAME   | TYPE                                | DESCRIPTION  |  |  | Software Mode                                   |
|-----|--------|-------------------------------------|--|--|--|---|
|     |        |                                     | Hardware Mode  |  |  |   |
|     |        |                                     | Normal Mode  | Differential Mode  | 8X Mode  |   |
| 23  | CSBIWO | Digital input<br>Internal pull-down | Wordlength:<br>Low for 16-bit data.<br>High for 20-bit (normal) or 24-bit I <sup>2</sup> S data. | Wordlength:<br>Low for 16-bit data.<br>High for 20-bit (normal) or 24-bit I <sup>2</sup> S data. | Wordlength:<br>Low for 20-bit data.<br>High for 24-bit data.           | Low for serial interface operation.             |
| 24  | MODE   | Digital input<br>Internal pull-up   | Low for hardware mode.   | Low for left mono mode.<br>High for right mono mode  | DINR   | High for software mode.                         |
| 25  | MUTEB  | Digital input<br>Internal pull-up   | Low to soft mute.<br>High for normal operation.  | Low to soft mute.<br>High for normal operation.  | Low to soft mute.<br>High for normal operation.                        | Low to soft mute.<br>High for normal operation. |
| 26  | MD/DM0 | Digital input<br>Internal pull-up   | De-emphasis mode select bit 0.   | Low for no de-emphasis.<br>High for 44.1kHz de-emphasis.   | LRP – LRCLK polarity select.   | Control serial interface data signal.           |
| 27  | MC/DM1 | Digital input<br>Internal pull-up   | De-emphasis mode select bit 1.   | Low for normal filter operation.<br>High for filter slow roll-off.                               | Unused.<br>Leave unconnected.  | Control serial interface clock signal.          |
| 28  | ML/I2S | Digital input<br>Internal pull-up   | Audio serial format:<br>Low – right justified.<br>High – I <sup>2</sup> S.                       | Audio serial format:<br>Low – right justified.<br>High – I <sup>2</sup> S.                       | Input data format:<br>Low – right justified.<br>High – left justified. | Control serial interface load signal.           |

Note: Digital input pins have Schmitt trigger input buffers.

## ABSOLUTE MAXIMUM RATINGS

Absolute Maximum Ratings are stress ratings only. Permanent damage to the device may be caused by continuously operating at or beyond these limits. Device functional operating limits and guaranteed performance specifications are given under Electrical Characteristics at the test conditions specified

ESD Sensitive Device. This device is manufactured on a CMOS process. It is therefore generically susceptible to damage from excessive static voltages. Proper ESD precautions must be taken during handling and storage of this device.

| CONDITION  | MIN   | MAX        |
|--|-------|------------|
| Supply voltage                                   | -0.3V | +7.0V      |
| Reference input                                  |       | VDD + 0.3V |
| Operating temperature range, T <sub>A</sub>      | -25°C | +85°C      |
| Storage temperature                              | -65°C | +150°C     |
| Package body temperature (soldering, 10 seconds) |       | +240°C     |
| Package body temperature (soldering, 2 minutes)  |       | +183°C     |

## RECOMMENDED OPERATING CONDITIONS

| PARAMETER               | SYMBOL      | TEST CONDITIONS | MIN  | TYP      | MAX  | UNIT |
|-------------------------|-------------|-----------------|------|----------|------|------|
| Digital supply range    | DVDD        |                 | -10% | 3.3 to 5 | +10% | V    |
| Analogue supply range   | AVDD        |                 | -10% | 3.3 to 5 | +10% | V    |
| Ground                  | AGND, DGND  |                 |      | 0        |      | V    |
| Difference DGND to AGND |             |                 | -0.3 | 0        | +0.3 | V    |
| Analogue supply current | AVDD = 5V   |                 |      | 15       |      | mA   |
| Digital supply current  | DVDD = 5V   |                 |      | 15       |      | mA   |
| Analogue supply current | AVDD = 3.3V |                 |      | 15       |      | mA   |
| Digital supply current  | DVDD = 3.3V |                 |      | 9        |      | mA   |

## ELECTRICAL CHARACTERISTICS

## TEST CONDITIONS

AVDD, DVDD = 5V, AGND, DGND = 0V,  $T_A = +25^{\circ}\text{C}$ ,  $f_s = 48\text{kHz}$ , SCKI = 256fs unless otherwise stated.

- Notes:**
- Ratio of output level with 1kHz full scale input, to the output level with all zeros into the digital input, measured 'A' weighted over a 20Hz to 20kHz bandwidth.
  - All performance measurements done with 20kHz low pass filter. Failure to use such a filter will result in higher THD+N and lower SNR and Dynamic Range readings than are found in the Electrical Characteristics. The low pass filter removes out of band noise; although it is not audible it may affect dynamic specification values.

## DEVICE DESCRIPTION

The WM8740 is a high performance 128fs oversampling rate stereo DAC employing a novel 64 level sigma delta DAC design which provides optimised signal-to-noise performance and clock jitter tolerance. It is ideally suited to high quality audio applications such as CD, DVD-audio, home theatre receivers and professional mixing consoles. The WM8740 supports sample rates from 8ks/s to 192ks/s.

The control functions of the WM8740 are either pin selected (hardware mode) or programmed via the serial interface (software mode). Control functions that are available include: data input word length and format selection (16-24 bits: I<sup>2</sup>S, left justified or right justified); de-emphasis sample rate selection (48kHz, 44.1kHz and 32kHz); differential output modes; a software or hardware mute and independently digitally controllable attenuation on both channels.

The digital filtering may be bypassed entirely by selecting MODE8X. Data is then input directly to the DAC, bypassing the digital filters. Left and right channels are input separately, using the MODE pin as the right channel input. This mode allows the use of alternative digital filters, such as the Pacific Microsonics PMD100 HDCD filter.

In addition to the normal stereo operating mode the WM8740 may also be used in dual differential mode with either the left or right channel (selectable) being output dual differentially. Two WM8740s can then be used in parallel to implement a stereo channel, each supporting a single channel differentially. Note that this mode uses 2 pairs of differential outputs for each channel – the benefit is SNR improved by 3dB. This mode is available in both software and hardware modes and may also be used in conjunction with MODE8X.

## SYSTEM CLOCK

Sample rates from 8ks/s up to 96ks/s are available, and automatically selected, with a system clock of 256fs or 384fs. In addition a system clock of 128fs or 192fs may be used, with sample rates up to 192ks/s. With a 128fs or 192fs system clock 64x oversampling mode operation is automatically selected and the first stage of the digital filter is bypassed.

WM8740 has an asynchronous monitor circuit, which in the event of removal of the master system clock, resets the digital filters and analogue circuits, muting the output. Re-application of the system clock re-starts the filters from an initialised state. Control registers are not reset under this condition.

The WM8740 is tolerant of asynchronous bit clock jitter. The internal signal processing resynchronises to the external LRCIN once the phase difference between bit clock and the system clock exceeds half an LRCIN period. During this re-synch period the interpolating filters will either miss or repeat an audio sample, minimising the audible effects of the operation. Table 1 shows the typical system clock frequency inputs for the WM8740.

| SAMPLING RATE<br>(LRCIN) | SYSTEM CLOCK FREQUENCY (MHZ) |        |             |             |
|--------------------------|------------------------------|--------|-------------|-------------|
|                          | 128fs                        | 192fs  | 256fs       | 384fs       |

| 192kHz                   | 24.576                       | 36.864 | Unavailable | Unavailable |

**Table 1 System Clock Frequencies Versus Sampling Rate**

## AUDIO DATA INTERFACE

Data may be input at a rate corresponding to the system clock having a rate of 256fs or 384fs, in which case an oversampling ratio of 128x is selected. Alternatively a rate of 128fs or 192fs may be used, in which case the first filter stage is bypassed and an oversampling ratio of 64x results. Finally, in MODE8X, data may be input at 8x the normal rate, in which case separate input pins are used to input the two stereo channels of data (unless DIFFHW mode and MODE8X are both selected, in which case only a mono channel is converted differentially). In MODE8X all filter stages are bypassed, prior to the sigma delta modulator. Data is input MSB first in all modes.

## NORMAL SAMPLE RATE

In normal mode, the data is input serially on one pin for both left and right channels.

Data can be “right justified” meaning that the last 16, 20 or 24 bits (depending on chosen PCM word length) that were clocked in prior to the transition on LRCIN are valid.

Alternatively data can be “left justified” (20 and 24-bit PCM data only), where the bits are clocked in as the first 20 or 24 bits after a transition on LRCIN.

For the three I<sup>2</sup>S modes supported (16-bit, 20-bit and 24-bit PCM data), data is clocked “left justified” except with one additional preceding clock cycle.

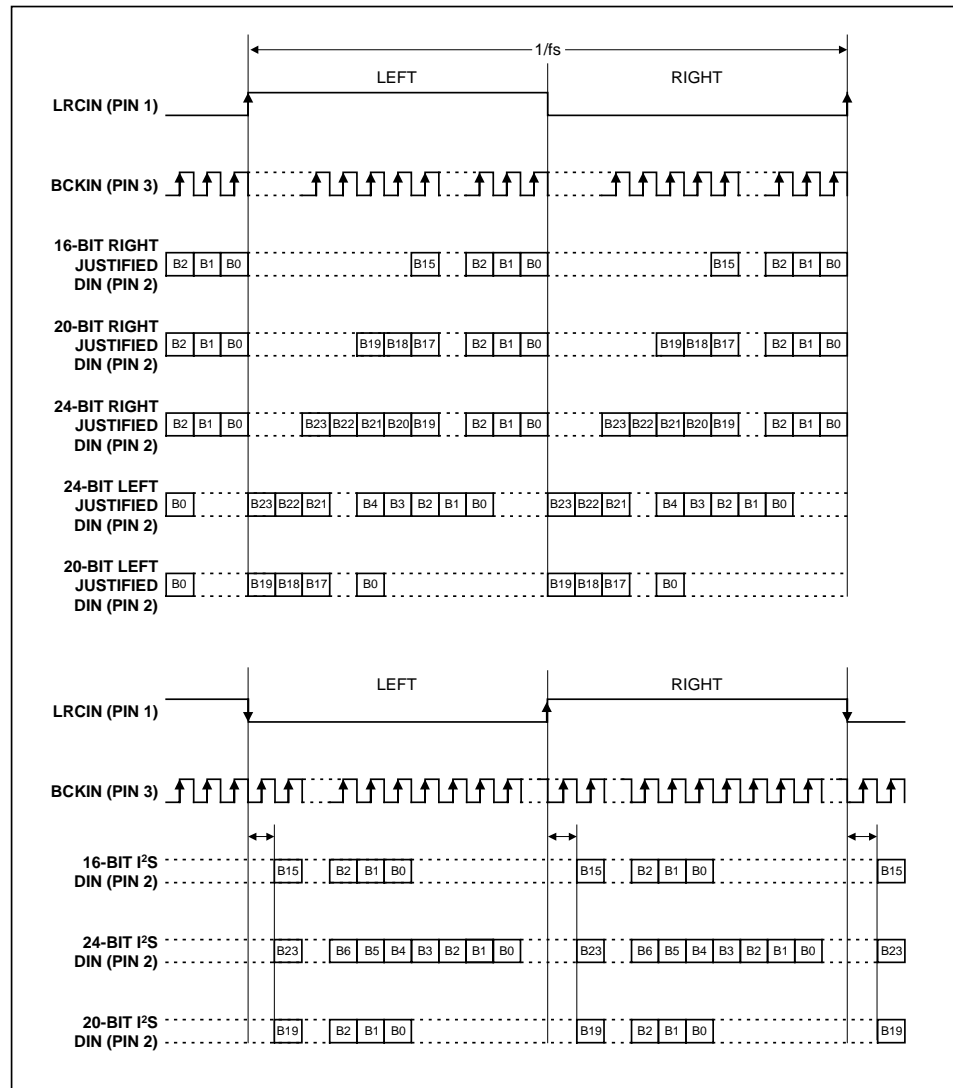

Figure 4 Audio Data Input Format

## 8 X FS INPUT SAMPLE RATE

Due to the higher speed of the interface in 8 x fs mode, audio data is input on two pins. The MODE pin (pin 24) is used as the second input for the right channel data and left data is input on DIN (pin2). In this mode, software control of the device is not available. The data can be input in two formats, left or right justified, selectable by ML/I2S and two word lengths (20 or 24 bit), selectable by CSBIWO. In both modes the data is always clocked in MSB first.

For left justified data the word start is marked by the falling edge of LRCIN. The data is clocked in on the next 20/24 BCKIN rising edges. This format is compatible with devices such as the PMD100.

For right justified the data is justified to the rising edge of LRCIN and the data is clocked in on the preceding 20/24 BCKIN rising edges before the LRCIN rising edge. This format is compatible with devices such as the DF1704 or SM5842.

In both modes the polarity of LRCIN can be switched using MD/DM0.

Differential hardware mode can be used in conjunction with 8fs mode by setting the DIFFHW pin high. In differential 8fs mode the data is input on DIN and output differentially. MODE is unused and must be tied low.

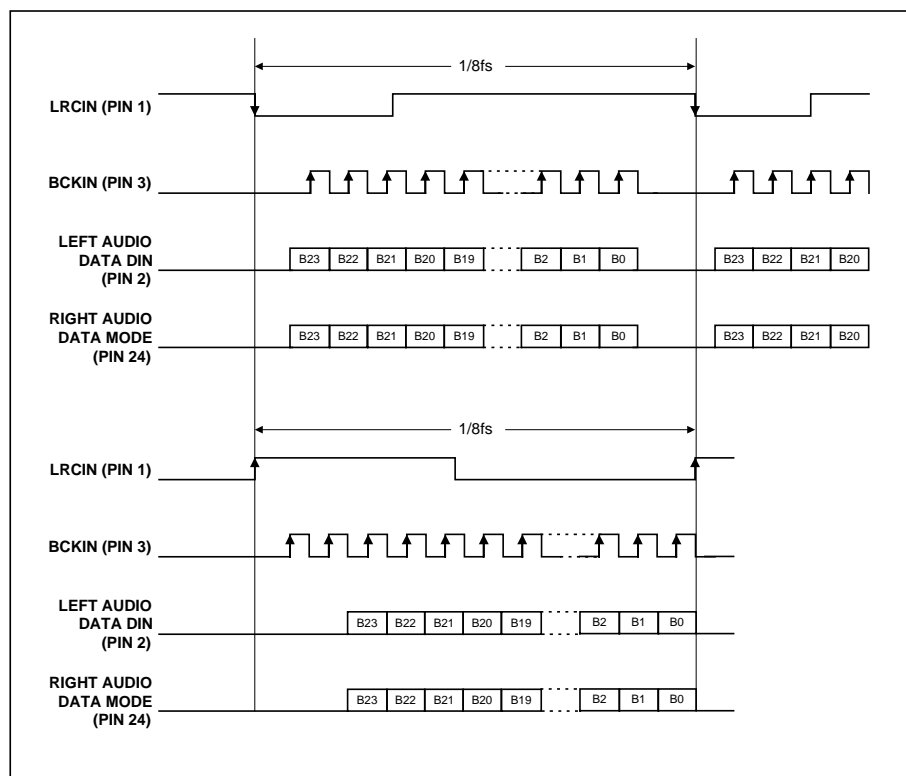

Figure 5 Audio Data Input Format (8 x fs Operation)

## MODES OF OPERATION

Control of the various modes of operation is either by software control over the serial interface, or by hard-wired pin control. Selection of software or hardware mode is via MODE pin. The following functions may be controlled either via the serial control interface or by hard wiring of the appropriate pins.

## HARDWARE CONTROL MODES

When the MODE pin is held 'low' the following hardware modes of operation are available. In Hardware differential mode or 8X mode some of these modes/control words are altered or unavailable.

**DE-EMPHASIS CONTROL**

| MDDM1<br>PIN 27 | MCDMO<br>PIN 26 | DE-EMPHASIS |
|-----------------|-----------------|-------------|
| L               | L               | Off         |
| L               | H               | 48kHz       |
| H               | L               | 44.1kHz     |
| H               | H               | 32kHz       |

**Table 2 De-Emphasis Control****AUDIO INPUT FORMAT**

| ML/I2S<br>PIN 28 | CSBIWO<br>PIN 23 | DATA FORMAT                   |
|------------------|------------------|-------------------------------|
| L                | L                | 16 bit normal right justified |
| L                | H                | 20 bit normal right justified |
| H                | L                | 16 bit I <sup>2</sup> S       |
| H                | H                | 24 bit I <sup>2</sup> S       |

**Table 3 Audio Input Format****SOFT MUTE**

| MUTEB<br>PIN 25 | FUNCTION                    |
|-----------------|-----------------------------|
| L               | Mute On (no output)         |
| H               | Mute Off (normal operation) |

**Table 4 Soft Mute**

A logic low on the MUTEB pin will cause the attenuation to ramp to infinite attenuation at a rate of 128/fs seconds per 0.5dB step. Setting MUTEB high will cause the attenuation to ramp back to its previous value.

**SOFTWARE CONTROL INTERFACE**

The WM8740 can be controlled using a 3-wire serial interface. MD/DM0 (pin 26) is used for the program data, MC/DM1 (pin 22) is used to clock in the program data and ML/I2S (pin 28) is used to latch in the program data. The 3-wire interface protocol is shown in Figure 6. CSB/IWO (pin 23) must be low when writing.

**Figure 6 Three-Wire Serial Interface**

## REGISTER MAP

WM8740 controls the special functions using 4 program registers, which are 16-bits long. These registers are all loaded through input pin MD/DM0. After the 16 data bits are clocked in, ML/I2S is used to latch in the data to the appropriate register. Table 5 shows the complete mapping of the 4 registers. Note that in hardware differential mode and 8X modes, software control is not available. The hardware differential mode (Diff[1:0]) clock loss detector disable (CDD) can only be accessed by writing to M2[8:5] with the pattern 1111. Register M4 is then accessible by setting A[2:0] to 110.

**Table 6 Register Bit Descriptions**

### DAC OUTPUT ATTENUATION

The level of attenuation for eight bit code X, is given by:

$$0.5 * (X - 255) \text{ dB}, \quad 1 \leq X \leq 255$$

$$-\infty \text{ dB (mute)}, \quad X = 0$$

Bit 8 in register 0 (LDL) is used to control the loading of attenuation data in B[7:0]. When LDL is set to 0, attenuation data will be loaded into AL[7:0], but it will not affect the filter attenuation. LDR in register 1 has the same function for right channel attenuation. Only when LDL or LDR is set to '1' will the filter attenuation be updated. This permits left and right channel attenuation to be updated simultaneously.

Attenuation level is controlled by AL[7:0] (left channel) or AR[7:0] (right channel). Attenuation levels are given in Table 7.

| X[7:0]  | ATTENUATION LEVEL |
|---------|-------------------|
| 00(hex) | - ∞dB (mute)      |
| 01(hex) | -127.0dB          |
| :       | :                 |
| :       | :                 |
| FD(hex) | -1.0dB            |
| FE(hex) | -0.5dB            |
| FF(hex) | 0.0dB             |

Table 7 Attenuation Control Level

Bit 2 in Reg3 is used to control the attenuator (ATC). When ATC is “high”, the attenuation data loaded in program register 0 is used for both the left and the right channels. When ATC is low, the attenuation data for each register is applied separately to left and right channels.

**SOFT MUTE**

| MUT<br>(REG2, B0) |                                  |
|-------------------|----------------------------------|
| L                 | Soft Mute off (normal operation) |
| H                 | Soft Mute on (no output)         |

Table 8 Soft Mute

Setting MUT causes the attenuation to ramp from the current value down to 00. The values held in the attenuation registers are unchanged. When MUT is reset the attenuation will ramp back up to the previous value. The ramp rate is 128/fs s/0.5dB step.

|-------------------|-------|
| L                 | Sharp |
| H                 | Slow  |

Table 14 Digital Filter Roll-Off Selection

**ANALOGUE OUTPUT POLARITY REVERSAL**

| REV<br>(REG3, B4) |          |
|-------------------|----------|
| L                 | Normal   |
| H                 | Inverted |

Table 15 Analogue Output Polarity Reversal

**CLKO OUTPUT FREQUENCY**

| CKO<br>(REG3, B5) |       |
|-------------------|-------|
| L                 | XTI   |
| H                 | XTI/2 |

Table 16 CLKO Output Frequency

**DE-EMPHASIS SAMPLE RATE**

| SF1<br>(REG3, B7) | SF0<br>(REG3, B6) | SAMPLE RATE    |
|-------------------|-------------------|----------------|
| 0                 | 0                 | No de-emphasis |
| 0                 | 1                 | 48kHz          |
| 1                 | 0                 | 44.1kHz        |
| 1                 | 1                 | 32kHz          |

Table 17 De-Emphasis Sample Rate

**INFINITE ZERO DETECT**

| IZD<br>(REG3, B8) |                      |
|-------------------|----------------------|
| L                 | Zero detect mute off |
| H                 | Zero detect mute on  |

Table 18 Infinite Zero Detect

### DIFFERENTIAL MONO MODE

Using bits 4 and 5, the differential output mode may be selected to be one of normal stereo, reversed stereo, mono left or mono right, as shown in Table 19.

| DIFF[1:0]<br>B[4:5]) | DIFFERENTIAL OUTPUT MODE  |
|----------------------|---|
| 00                   | Stereo  |
| 01                   | Stereo reverse.   |
| 10                   | Mono left – differential outputs.<br>VOUTL is left channel.<br>VOUTR is the negative of left channel. |
| 11                   | Mono right – differential outputs.<br>VOUTL is the negative right channel.<br>VOUTR is right channel. |

**Table 19 Differential Output Modes**

Using these controls a pair of WM8740 devices may be used to build a dual differential stereo implementation with higher performance and differential output.

Note: DIFFHW mode pin may be used to achieve the same result by hardware means.

### CLOCK LOSS DETECTOR DISABLE

| CDD (REG4, B6) |                         |
|----------------|-------------------------|
| L              | Clock loss detector on  |
| R              | Clock loss detector off |

**Table 20 Clock Loss Detector Disable**

When the system clock is inactive for approximately 100µs, the clock loss detector circuit detects the loss of clock and the analogue circuitry is forced into a mute condition and the digital filters reset. Setting the CDD bit disables this behaviour.

## MUTE MODES

The device has various mute modes.

|   | DIGITAL FILTER  | ANALOGUE |   |
|---|---|----------|---|
|   |   | ANRES    | ANMUTE  |
| Reg bit OPE = '1'                         | Unaffected  |          | Asserted  |
| MUTE pin                                  | Gain ramped to zero<br>On release volume ramps to previous value                                    |          | Asserted when gain = 0                            |
| AUTOMUTE (detect 1024 zero input samples) | Automute has no effect on digital filters   |          | Asserted after 1024 zero input samples if IZD = 1 |
| Reg bit MUT                               | As MUTE pin   |          | As MUTE pin                                       |
| Gain = 00 (left & right)                  | Gain = -∞dB   |          | Asserted  |
| RAM initialise                            | Gain initialised to 0dB   |          | Asserted  |
| Loss of system clock                      | Not running (no clock). On clock restart, filters initialised, RAM initialised. Registers unchanged | Asserted | Asserted  |
| No LRCLK or invalid SCLK/LRCLK ratio      | Filters initialised, RAM initialised. Registers unchanged   | Asserted | Asserted  |
| RB  | Reset – gain initialised to 0dB   | Asserted | Asserted  |
| Power-on reset                            | Reset   | Asserted | Asserted  |

**Table 21 Mute Modes**

- ANRES is the reset to the switched capacitor filter.
- ANMUTE is an analogue muting signal gating the analogue signal at the output (after the SC filter)
- AUTOMUTE is asserted when both the IZD register bit is asserted and the input audio data has been zero on both left and right channels for 1024 input samples. The first non-zero sample de-asserts.
- Applying a logic low to MUTEB or setting MUT in Reg2 causes the gain registers to ramp to zero. When a logic high is applied, the gain ramps slowly back up to the value held in the appropriate attenuation register (AL or AR). The ramp rate =  $128/\text{fs}$  s/0.5dB step.

## RECOMMENDED EXTERNAL COMPONENTS

Figure 15 External Components Diagram

## RECOMMENDED EXTERNAL COMPONENTS VALUES

| COMPONENT REFERENCE | SUGGESTED VALUE | DESCRIPTION   |
|---------------------|-----------------|---|
| C1 and C6           | 10 $\mu$ F      | De-coupling for DVDD and AVDD.                                |
| C2 to C5            | 0.1 $\mu$ F     | De-coupling for DVDD and AVDD.                                |
| C7 and C8           | 10 $\mu$ F      | Output AC coupling caps to remove VMID DC level from outputs. |
| C9 and C11          | 0.1 $\mu$ F     | Reference de-coupling capacitors for VMIDR and VMIDL.         |
| C10 and C12         | 10 $\mu$ F      |   |
| R1                  | 10k $\Omega$    | Resistor to AVDD for open drain output operation.             |
